OPTILOAD SMART

CAPACITY PLANNING · CAPABILITIES OVERVIEW

Your production data already has the answer. OptiLoad Smart gets it out in under 10 seconds.

Full factory capacity, backlog and cost — for every line, every shift — calculated directly from the Excel files you already maintain. Seven connected modules, installed on-site, no cloud and no API integration.

10 s	**7**	**0**	**Any**
to full factory capacity	connected planning modules	cloud uploads — data stays on site	number of lines, parts and shifts

OPTILOAD SMART

HOW IT WORKS

Three steps. No new workflow.

1

Connect your data

Forecast, allocation and cycle times are read directly from your existing Excel file.

2

Validate & self-audit

Missing cycle times, unallocated volumes and unreadable rows are flagged before they distort a calculation.

3

Get your answer

Capacity, backlog and cost per line and per week — then plan the day, in under 10 seconds.

THE SEVEN MODULES

- **01** Data Onboarding
- **02** Factory Load Planner
- **03** Capacity Analytics
- **04** Data Integrity Audit
- **05** Planning Adjustments
- **06** Recovery Simulator
- **07** Daily Load Planner
- + One-click PDF reporting from any dashboard

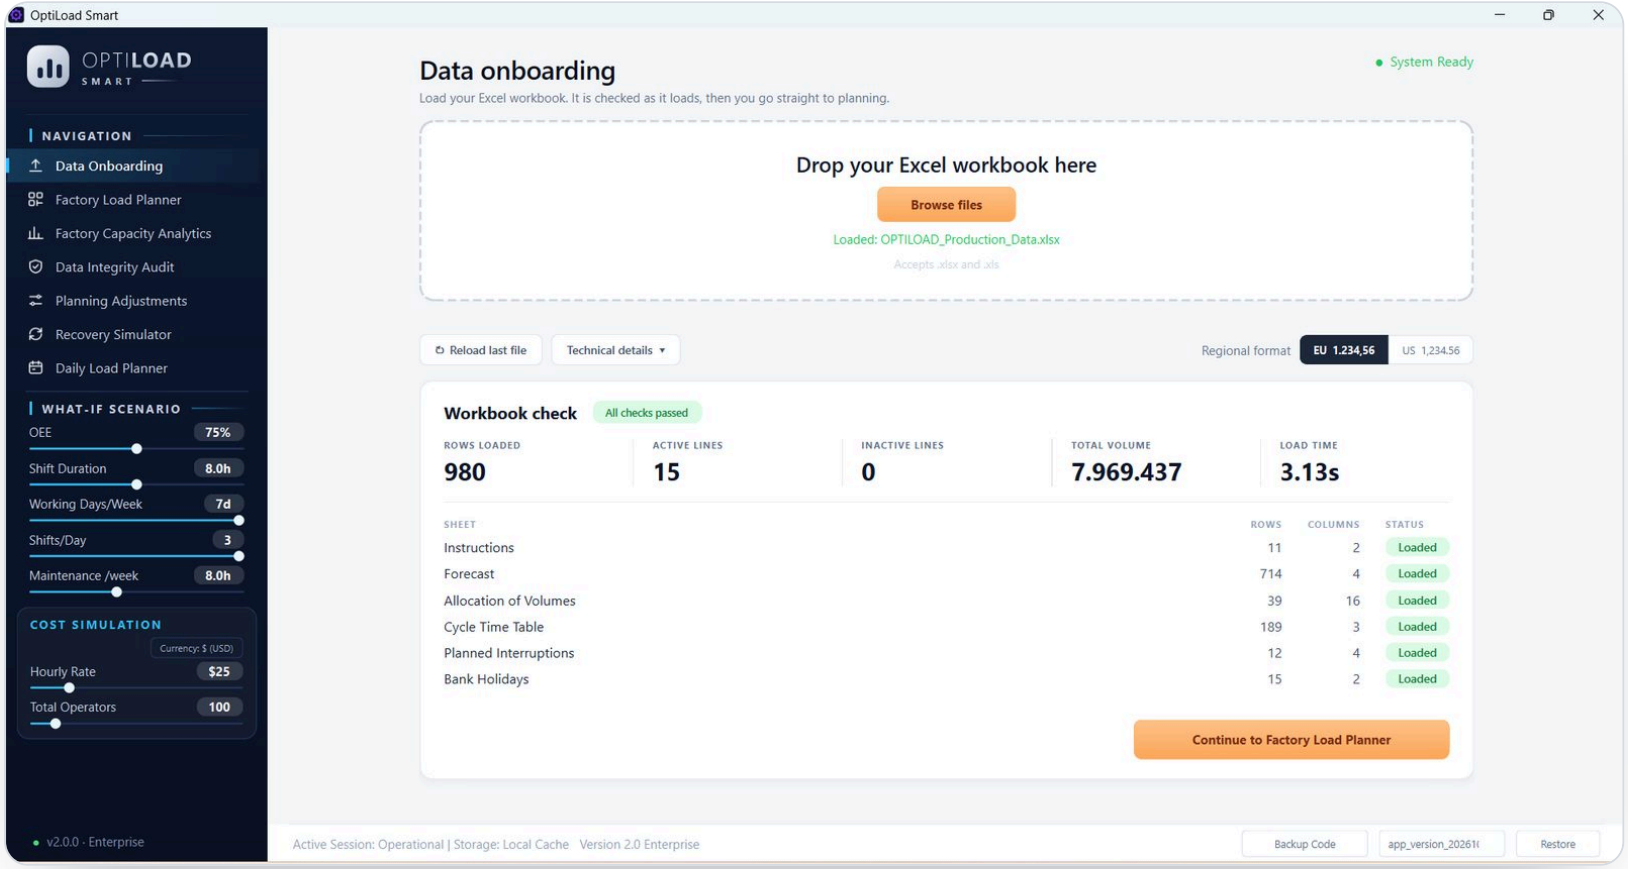

OPTILOAD SMART

01 / 07 · DATA ONBOARDING

Drop your Excel file. Planning starts in seconds.

OptiLoad Smart detects all five source sheets automatically, validates every row and flags anything it cannot read — with a live process log and a duplicate check, so you see exactly what was loaded.

- Reads your existing forecast, allocation and cycle-time files
- Row-level validation with a clear process log
- EU / US number formats detected automatically

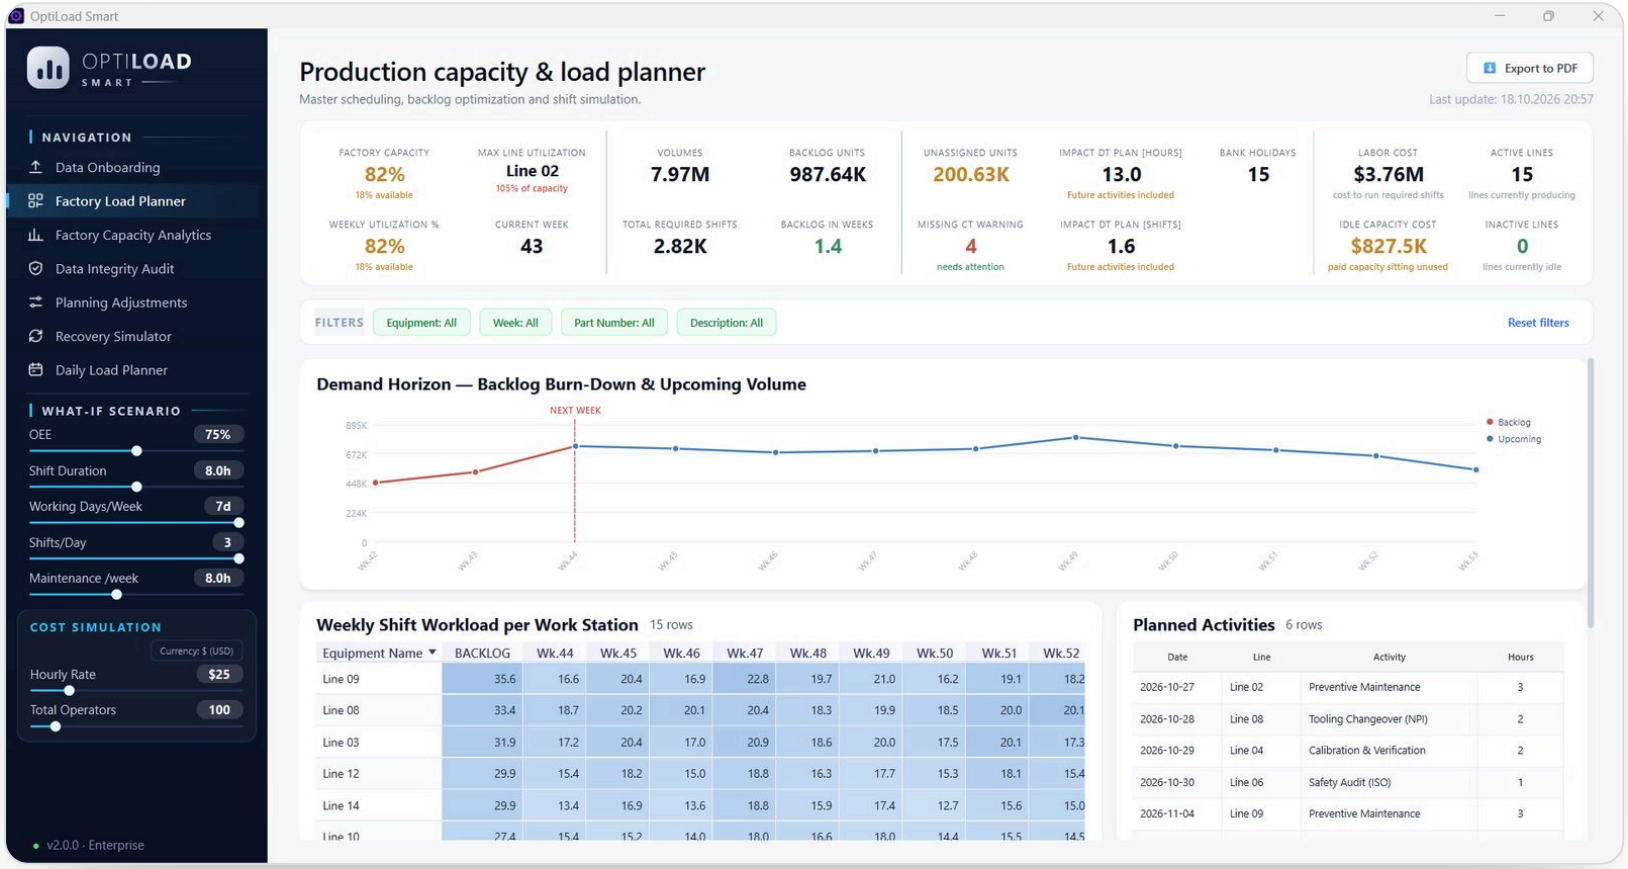

OPTILOAD SMART

02 / 07 · FACTORY LOAD PLANNER

The whole factory on one screen.

Factory capacity, backlog in weeks, unassigned volume, interruptions and labor cost — with the backlog burn-down, weekly shift workload per work station and every planned activity in view. Plans forward from next week, since this week is already committed.

- Utilization and required shifts for every line
- Backlog burn-down and upcoming volume by week
- Planned interruptions counted in the load
- One-click export to a presentation-ready PDF

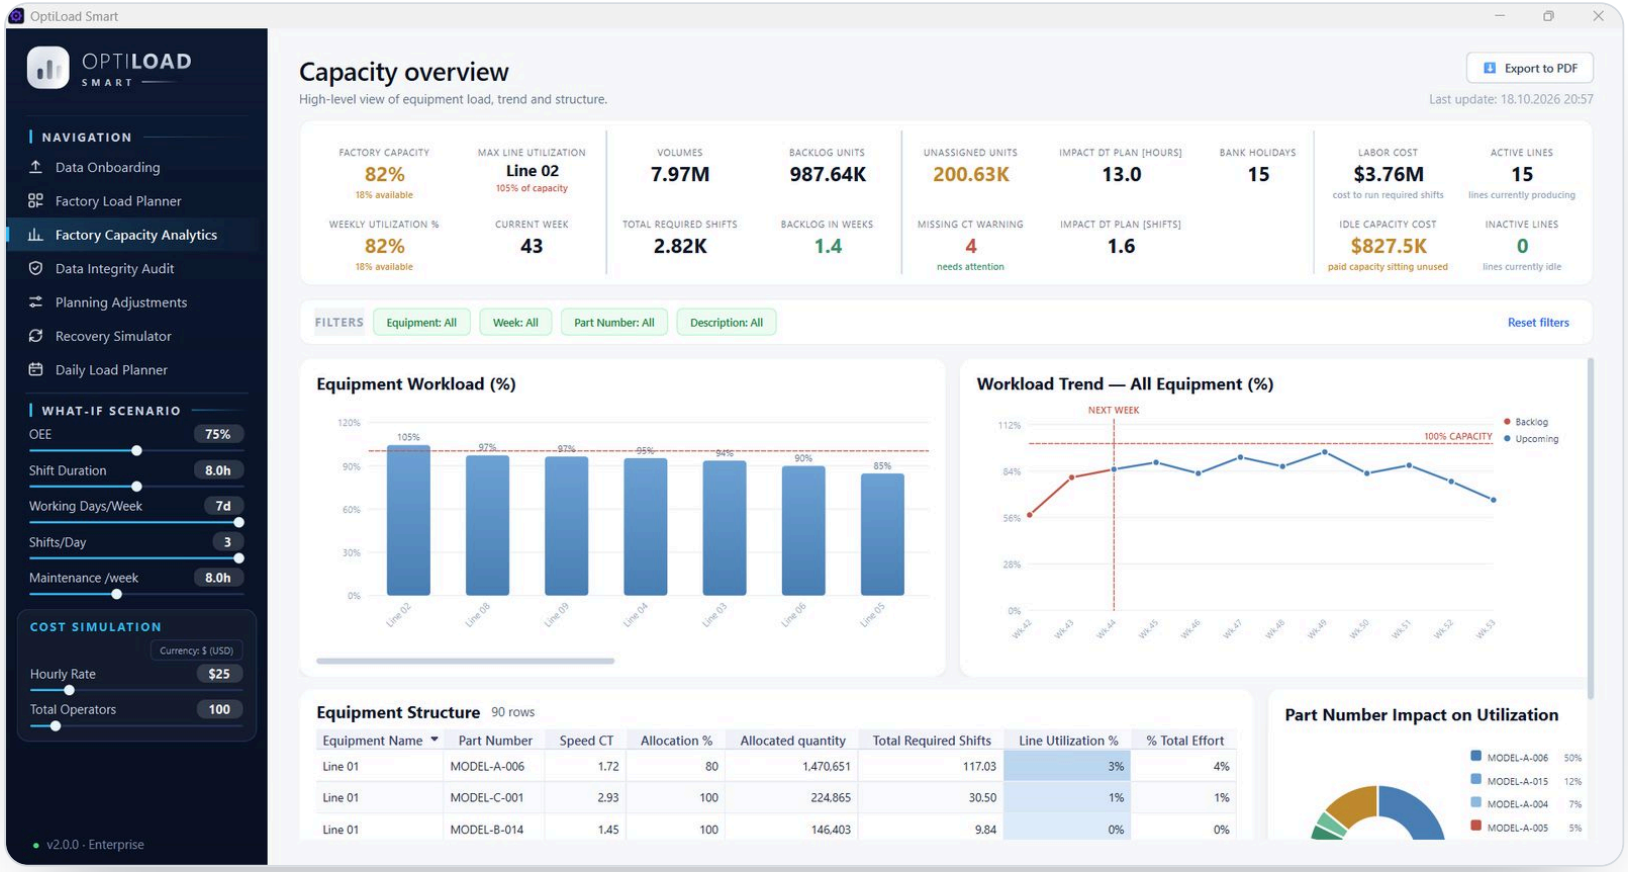

OPTILOAD SMART

03 / 07 · CAPACITY ANALYTICS

Which equipment is overloaded — and by how much.

Utilization, backlog, idle cost and labor cost for every line and for the whole plant. The what-if sliders recalculate every number and chart instantly: OEE, shift length, working days, shifts per day, maintenance and headcount.

- Overloaded lines and spare capacity side by side
- Idle-capacity and labor cost modeled together
- What-if scenarios recalculate in seconds

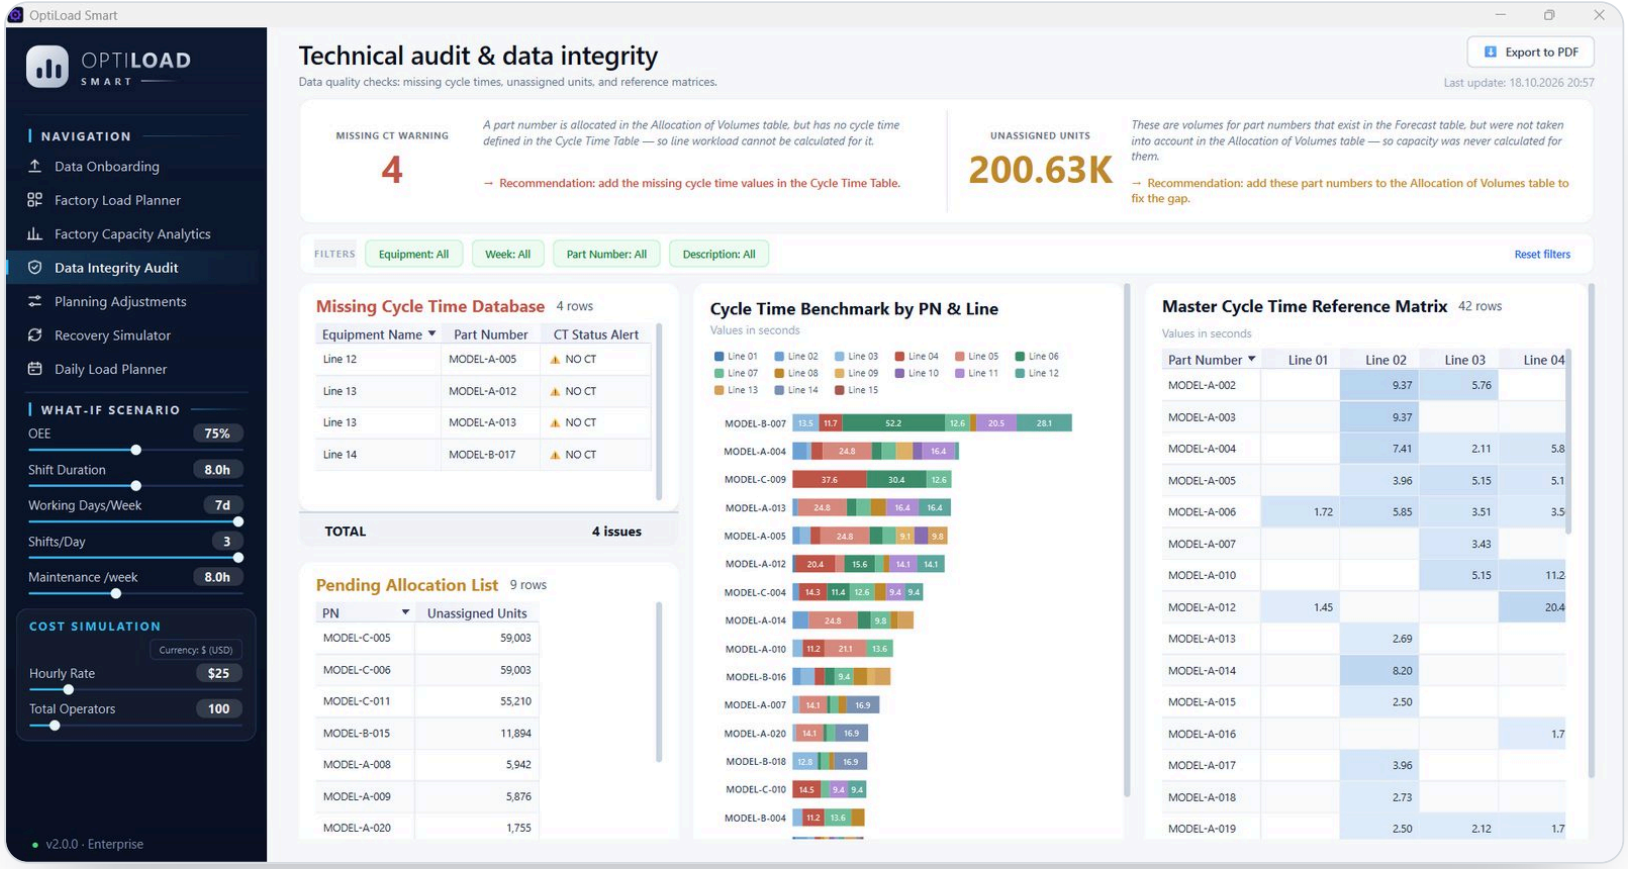

04 / 07 · DATA INTEGRITY AUDIT

The self-audit a spreadsheet never does.

Missing cycle times, unallocated forecast volumes and a full part × equipment cycle-time reference — flagged before they distort a calculation, each with a clear recommendation on how to fix it.

- Missing cycle times and their volume impact
- Forecast volume with no equipment assigned
- Every number traceable to its source

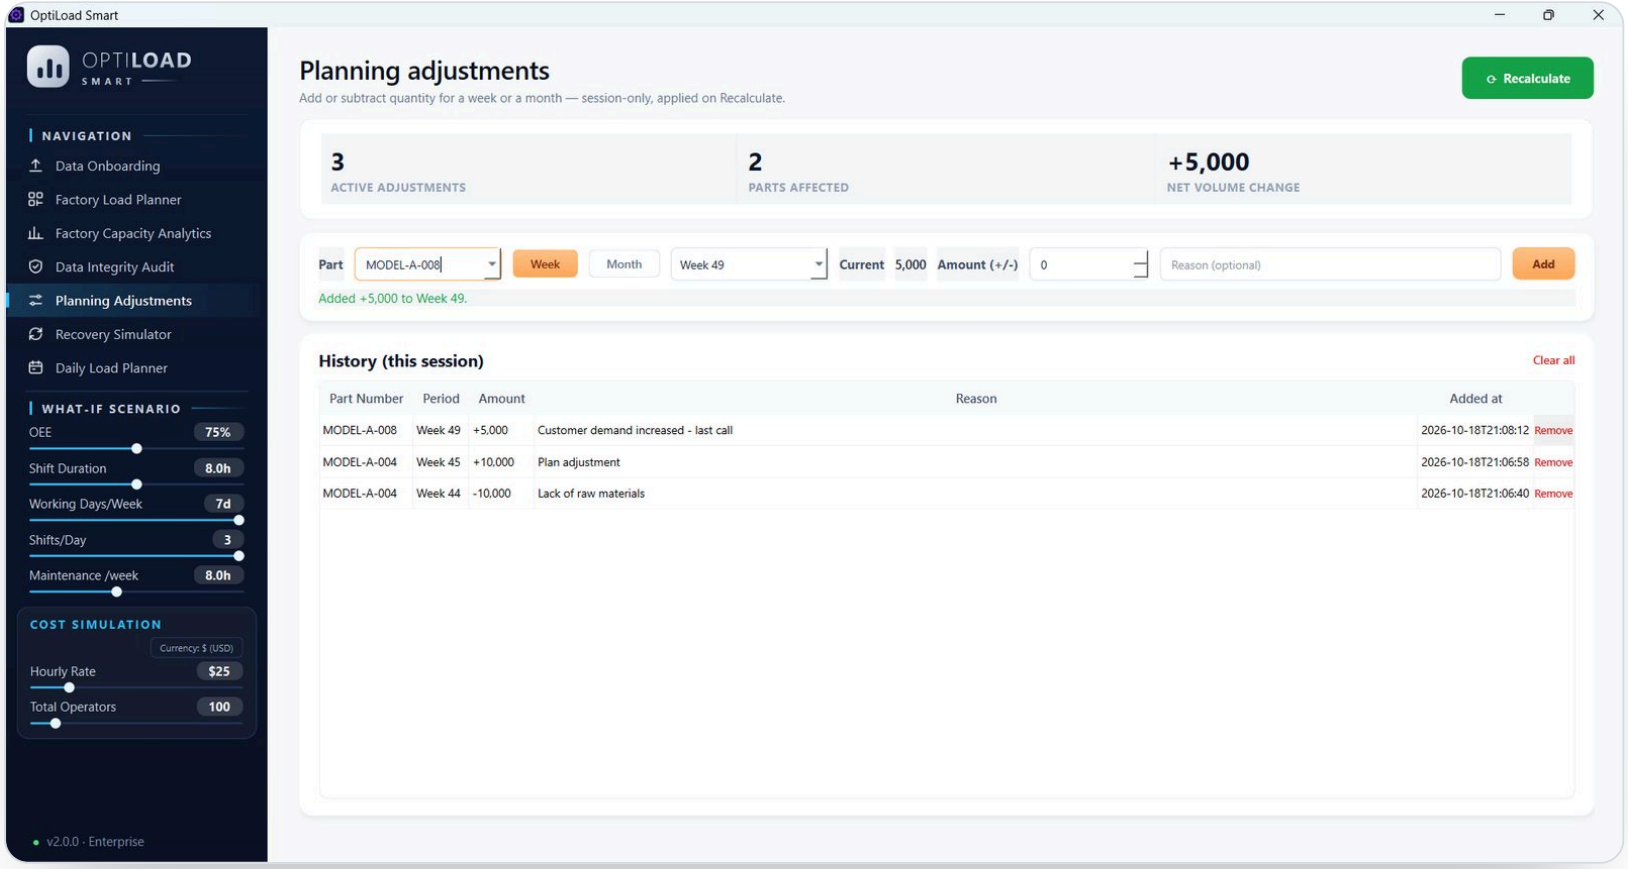

05 / 07 · PLANNING ADJUSTMENTS

Change the forecast. Without touching the file.

Add or subtract volume for any part number, at week or month level — a customer change, a material shortage — and recalculate the full plan across every dashboard. Session-only by design, so scenarios never reach the source Excel.

- Week- or month-level volume adjustments
- Every dashboard updates at once
- Source file stays untouched

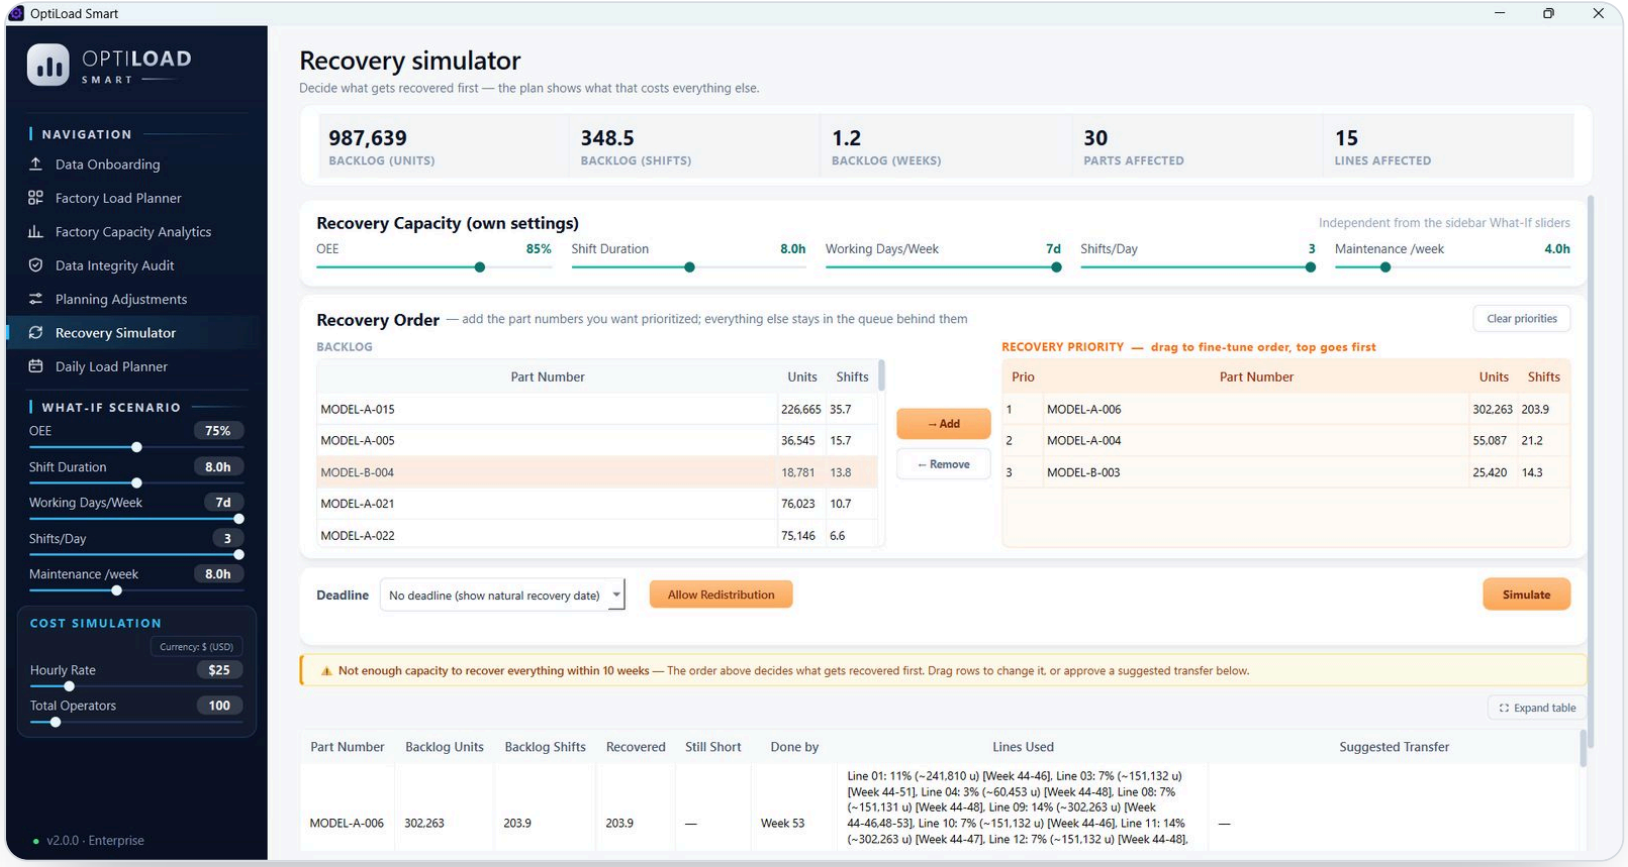

06 / 07 · RECOVERY SIMULATOR

Decide what gets recovered first.

Set priorities, working days and recovery horizon; the simulator rebalances lines, suggests transfers between equipment and shows what is still short of the deadline — and what each choice costs everything else.

- Priority order for part numbers
- Suggested transfers between lines
- Backlog, spare capacity and recovery date, live

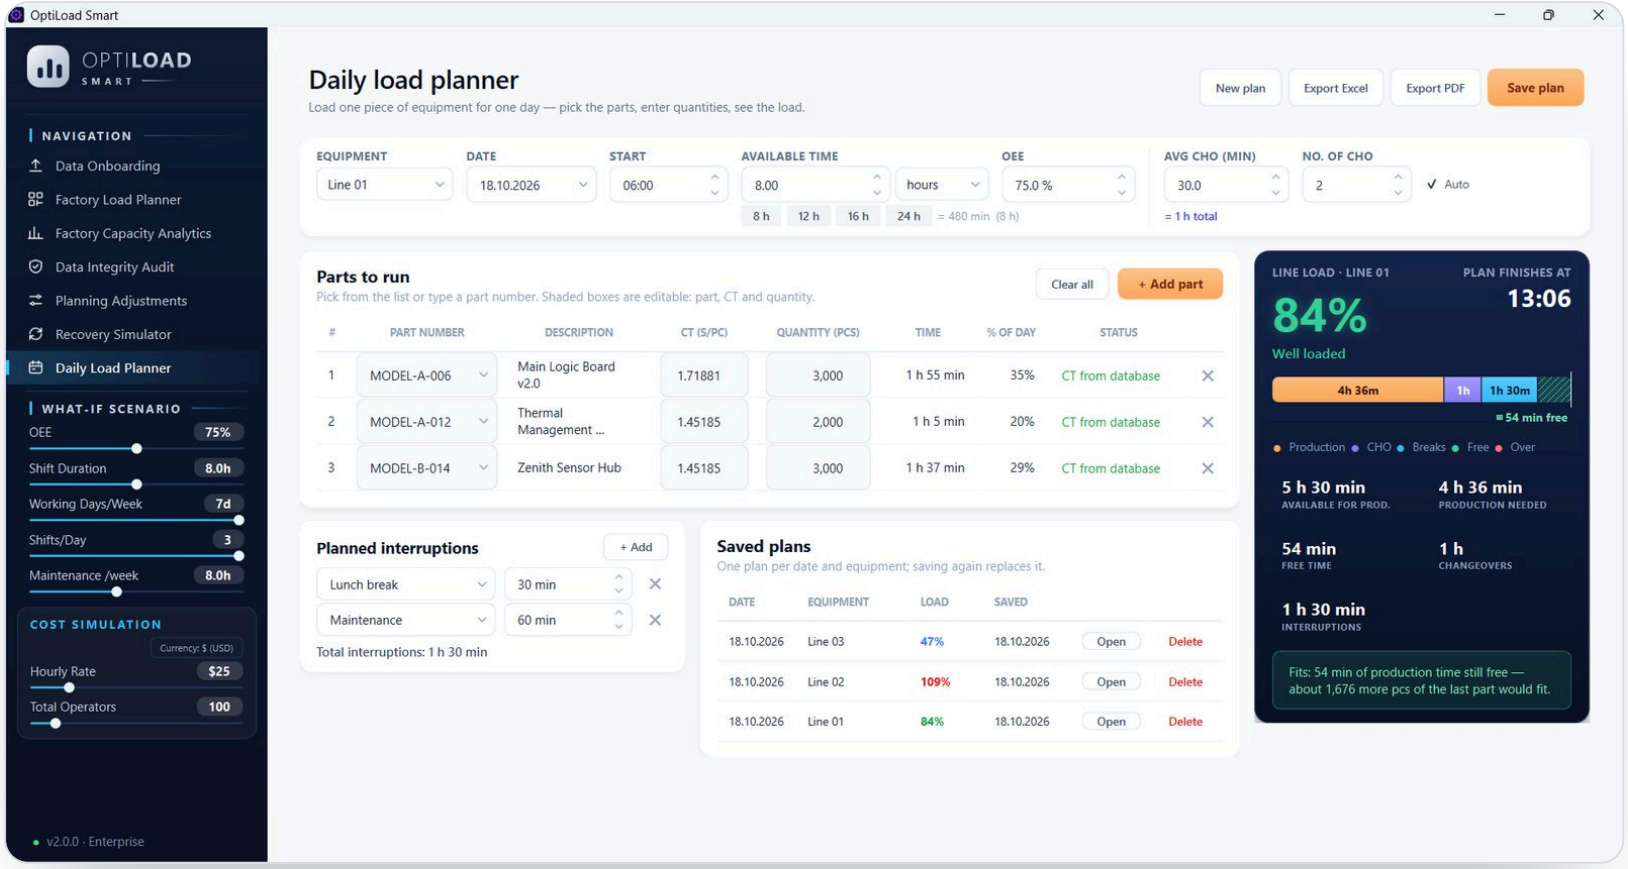

07 / 07 · DAILY LOAD PLANNER

One plan per day and line — saved and shared.

Pick the equipment and the date, add the parts and quantities, and see the load: production time, changeovers, breaks, interruptions, the finish time and whether the last part still fits. Plans save with one click and can be reopened or shared with the team.

- Cycle times pulled from your database
- Changeovers and interruptions on autopilot
- Saved plans per date and line, export to Excel or PDF

OPTILOAD
SMART

AND MORE

Built for how planning actually happens.

Always plans from next week
This week's orders are already committed — treated as backlog, planning always runs forward.

Messy real-world files
EU/US number formats, duplicate checks and safe handling of unreadable rows.

Single calendar year
Forecast dates stay within one Jan–Dec year, so week numbers are never ambiguous.

Cost simulation
Overtime, idle-capacity and labor cost modeled together.

Take-rate simulation
Test demand shifts and rebalance load across equipment.

Fully scalable
Any number of lines, part numbers or shifts — no reconfiguration.

YOUR DATA STAYS YOURS

Runs entirely on your own machine — no cloud upload, no third-party server, no internet required. Your Excel files stay where they are, every result exports back out, and there is nothing to migrate if you cancel.

−80%
Planning time
What took most of a Friday takes under 10 seconds.

$M
Cost made visible
Overtime and idle cost shown per line, every week.

1 mtg
One shared number
Planning and production open the same dashboard.

OPTILOAD SMART

PRICING & NEXT STEP

Sized to your footprint, not your line count.

Single-Site
€18–25k
per year · one facility, unlimited lines

Multi-Site
€40–60k
per year · 2–5 facilities

Enterprise / Group
€75k+
per year · 6+ facilities

All editions include every module, assisted onboarding and unlimited users. Multi-Year planning (up to 10 years ahead) is in early access.

Book a 20-minute walkthrough on your own numbers.
